Installed systems for high-performance homes

Are you looking to build a comfortable, healthy, efficient home? Are you tired of cold damp homes with crying windows and mould, or excessive power bills? Whether you're targeting a Certified Passive House, Homestar® or simply wanting to build above building code, we offer expert advice to help you choose which systems will be most suitable for your new build or renovation. Then we install them, properly.

Our focus is on optimising the thermal envelope, starting with insulation, air-tightness and ventilation - the key foundations of a great home. We also offer efficient air and water heating, such as low emission fires for air-tight homes. We offer state of the art Tether home monitoring systems to fully understand how your home is performing. **The earlier we are involved, the more we can help.**

With years of experience in high-performance homes, and having built our own Certified Passive House Plus, 10 Homestar show-home, we understand the complexities of these projects as well as the importance of proper sequencing. Give us a call or drop us an email - we'd love to discuss your project with you, your designer or your builder, or recommend a suitable professional to help.
